

Condat's removable liner

TBM lubricant supplier, Condat, known for its biodegradable and non-flammable products, has released CONDAT CLEAN PACK, a drum with a removable liner that enables optimization of the recycling processes making life easier for its customers.

Drum cleaning and recycling can be costly. To meet this constraint, Condat is now equipping its drums with a removable internal liner to contain products such as its GR130 greases, WR89NG sealants and HBW NG main-bearing sealing paste.

When pumping tail seal greases, sealing pastes and other compounds, a residual quantity of product always remains at the bottom of the drums. To minimize recycling costs, tunnel workers have to clean them. This task can be somewhat difficult because of the

adhesive properties of the products.

Currently, when drums are removed and sent for recycling, each kilo of residual product beyond a tolerance of 0.5%, is invoiced and can generate significant additional operating costs.

The CONDAT CLEAN PACK solution - to equip barrels with a removable liner:

- Clean: the bag is easier to recycle than soiled drums and thus avoids high disposal costs.
- Easy to use: perfectly adapted to the diameter of the drum, it does not slip during pumping.
- Economical: no need for an operator to clean drums anymore, thus leading to productivity increase.
- Cost-effective: removing the liner from the drum makes it possible to check the weight

of the residues and to better regulate the pumping, thus optimizing the consumption of products.

To date, a series of jobsites are already using this product, including the Paris subway - line 14, Nice T2, Lyon's Turin Ferroviaire and the LH3 shipyard at Maison Laffitte. Further to this success, all Condat products will be delivered in barrels equipped with a removable liner from the beginning of 2018 worldwide.
